#### **GLM** review

The Design Matrix

### Components of GLM

- Random component specifies the conditional distribution for the response variable
  - doesn't have to be normal
  - can be any distribution in the "exponential" family of distributions
- Systematic component specifies linear function of predictors (linear predictor)
- **Link** [denoted by g(.)] specifies the relationship between the expected value of the random component and the systematic component
  - can be linear or nonlinear

The Design Matrix

## Logistic Regression as GLM

 $Logit(P(x)) = log\left(\frac{P(x)}{1 - P(x)}\right) = \beta_0 + \beta_1 x_{1i} + \beta_2 x_{2i} + ... + \beta_p x_p$ 

The model:

- Random component: *y<sub>i</sub>* follows a Binomial distribution (outcome is a binary variable)
- Systematic component: linear predictor

$$\beta_0 + \beta_1 x_{1i} + \beta_2 x_{2i} + \dots + \beta_p x_{pi}$$

• **Link function**: *logit* (log of the odds that the event occurs)

$$g(P(x)) = logit(P(x)) = log\left(\frac{P(x)}{1 - P(x)}\right)$$

$$P(\mathbf{y}) = \sigma^{-1}(\beta_0 + \beta_1 \mathbf{y}_1 + \beta_0 \mathbf{y}_2 + \beta_1 \mathbf{y}_1)$$

#### Levi Waldron

Learning objectives and outline

#### **GLM** review

The Design Matrix

# Additive vs. Multiplicative models

- Linear regression is an additive model
  - e.g. for two binary variables  $\beta_1 = 1.5$ ,  $\beta_2 = 1.5$ .
  - If  $x_1 = 1$  and  $x_2 = 1$ , this adds 3.0 to E(y|x)
- Logistic regression is a *multiplicative* model
  - If  $x_1 = 1$  and  $x_2 = 1$ , this adds 3.0 to  $log(\frac{P}{1-P})$
  - Odds-ratio  $\frac{P}{1-P}$  increases 20-fold: exp(1.5+1.5) or exp(1.5) \* exp(1.5)

# Interaction / Effect Modification

 What if we want to know whether the effect of age is modified by whether the woman wants more children or not?

Interaction is modeled as the product of two covariates:

$$E[y|x] = \beta_0 + \beta_1 x_1 + \beta_2 x_2 + \beta_{12} x_1 * x_2$$

### The Design Matrix

Levi Waldron

Learning objectives and outline

GLM review

The Design Matrix

# What is the design matrix, and why?

- What? The design matrix is the most generic, flexible way to specify them
- Why? There are multiple possible and reasonable regression models for a given study design.

#### Levi Waldron

Learning objectives and outline

GLM review

The Design Matrix

# Matrix notation for the multiple linear regression model

$$\begin{pmatrix} Y_1 \\ Y_2 \\ \vdots \\ Y_N \end{pmatrix} = \begin{pmatrix} 1 & x_1 \\ 1 & x_2 \\ \vdots & & \\ 1 & x_N \end{pmatrix} \begin{pmatrix} \beta_0 \\ \beta_1 \end{pmatrix} + \begin{pmatrix} \varepsilon_1 \\ \varepsilon_2 \\ \vdots \\ \varepsilon_N \end{pmatrix}$$

or simply:

$$\mathbf{Y} = \mathbf{X}\boldsymbol{\beta} + \boldsymbol{\varepsilon}$$

- The design matrix is X
  - which the computer will take as a given when solving for  $\beta$  by minimizing the sum of squares of residuals  $\varepsilon$ , or maximizing likelihood.

Learning objectives and outline

GLM review

The Design Matrix

### Choice of design matrix

• The model formula encodes a default model matrix, e.g.:

```
group <- factor( c(1, 1, 2, 2) )
model.matrix(~ group)</pre>
```

Levi Waldron

The Design Matrix

# Design matrix to contrast what we want

- Contraceptive use example
  - Is the effect of wanting more children different for 40-49 year-olds than for <25 year-olds is answered by the term age40-49:wantsMoreyes in a model with interaction terms:

```
##
## Call:
## glm(formula = cbind(using, notUsing) ~ age * wants
## data = cuse)
##
## Deviance Residuals:
## Min 10 Median 30 Max
```

Learning

objectives and outline
GLM review

The Design Matrix Design matrix to contrast what we want (cont'd)

 What if we want to ask this question for 40-49 year-olds vs. 30-39 year-olds?

The desired contrast is:

age40-49:wantsMoreyes - age30-39:wantsMoreyes

There are many ways to construct this design, one is with library(multcomp):

```
names(coef(fitX))
```

```
## [1] "(Intercept)" "age25-29"

## [4] "age40-49" "wantsMoreyes"

## [7] "age30-39:wantsMoreyes" "age40-49:wantsMoreyes
```

contmat <- matrix(c(0,0,0,0,0,0,-1,1), 1)
new.interaction <- multcomp::glht(fitX, linfct=contmagnery(new.interaction))</pre>
