GLM review

Interpretation of main effects and interactions in logistic regression

The Design Matrix

Components of GLM

- Random component specifies the conditional distribution for the response variable
 - doesn't have to be normal
 - can be any distribution in the "exponential" family of distributions
- Systematic component specifies linear function of predictors (linear predictor)
- **Link** [denoted by g(.)] specifies the relationship between the expected value of the random component and the systematic component
 - can be linear or nonlinear

Levi Waldron

Learning objectives and outline

GLM review

Interpretation of main effects and interactions in logistic regression

The Design Matrix

Logistic Regression as GLM

• The model:

$$Logit(P(x)) = log\left(\frac{P(x)}{1 - P(x)}\right)$$
$$= \beta_0 + \beta_1 x_{1i} + \beta_2 x_{2i} + \dots + \beta_p x_{pi}$$

- Random component: y_i follows a Binomial distribution (outcome is a binary variable)
- Systematic component: linear predictor

$$\beta_0 + \beta_1 x_{1i} + \beta_2 x_{2i} + \dots + \beta_p x_{pi}$$

• Link function: logit (log of the odds that the event occurs)

$$g(P(x)) = logit(P(x)) = log\left(\frac{P(x)}{1 - P(x)}\right)$$

$$P(x) = g^{-1} (\beta_0 + \beta_1 x_{1i} + \beta_2 x_{2i} + \dots + \beta_p x_{pi})$$

Levi Waldron

Learning objectives and outline

GLM review

Interpretation of main effects and interactions in logistic regression

The Design

Additive vs. multiplicative models

- 1 Linear regression is an *additive* model
 - e.g. for two binary variables $\beta_1 = 1.5$, $\beta_2 = 1.5$.
 - If $x_1 = 1$ and $x_2 = 1$, this adds 3.0 to E(y|x)
- 2 Logistic regression is a multiplicative model
 - It is additive on log-odds scale
 - If $x_1 = 1$ and $x_2 = 1$, this adds 3.0 to $log(\frac{P}{1-P})$
 - Odds-ratio $\frac{P}{1-P}$ increases 20-fold: exp(1.5+1.5) or exp(1.5)*exp(1.5)

Interpretation of main effects and interactions in logistic regression

The Design Matrix

Interpretation of "wants more children" coefficients

Additive coefficient interpretation on log-odds scale

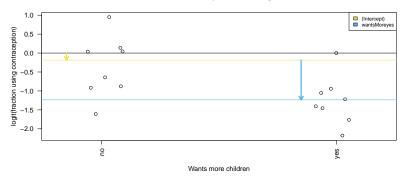

Figure 1: Diagram of the estimated coefficients in the GLM. The yellow arrow indicates the Intercept term, which goes from zero to the mean of the reference group (here the 'wantsMore = no' samples). The blue arrow indicates the difference in log-odds of the yes group minus the no group, which is negative in this example. The circles show the individual samples, jittered horizontally to avoid overplotting.

Levi Waldron

Learning objectives and outline

GLM review

Interpretation of main effects and interactions in logistic regression

The Design Matrix

Interaction / Effect Modification

 What if we want to know whether the effect of age is modified by whether the woman wants more children or not?

Interaction is modeled as the product of two covariates:

$$E[y|x] = \beta_0 + \beta_1 x_1 + \beta_2 x_2 + \beta_{12} x_1 * x_2$$

Levi Waldron

Learning objectives and outline

GLM review

Interpretation of main effects and interactions in logistic regression

The Design Matrix

Interaction / Effect Modification (fit)

Interpretation of main effects and interactions in logistic regression

The Design Matrix

The Design Matrix

Levi Waldron

Learning objectives and outline

GLM review

Interpretation of main effects and interactions in logistic regression

The Design Matrix

What is the design matrix, and why?

- 1 What? The design matrix is the most generic, flexible way to specify them
- **2** Why? There are multiple possible and reasonable regression models for a given study design.

Levi Waldron

Learning objectives and outline

GLM review

Interpretation of main effects and interactions in logistic regression

The Design Matrix

Matrix notation for the multiple linear regression model

$$\begin{pmatrix} Y_1 \\ Y_2 \\ \vdots \\ Y_N \end{pmatrix} = \begin{pmatrix} 1 & x_1 \\ 1 & x_2 \\ \vdots & & \\ 1 & x_N \end{pmatrix} \begin{pmatrix} \beta_0 \\ \beta_1 \end{pmatrix} + \begin{pmatrix} \varepsilon_1 \\ \varepsilon_2 \\ \vdots \\ \varepsilon_N \end{pmatrix}$$

or simply:

$$\mathbf{Y} = \mathbf{X}\boldsymbol{\beta} + \boldsymbol{\varepsilon}$$

- The design matrix is X
- the computer will take X as a given when solving for β by minimizing the sum of squares of residuals ε , or maximizing likelihood.

Levi Waldron

Learning objectives and outline

GLM review

Interpretation of main effects and interactions in logistic regression

The Design Matrix

Choice of design matrix

• The model formula encodes a default model matrix, e.g.:

```
group <- factor( c(1, 1, 2, 2) )
model.matrix(~ group)</pre>
```

Levi Waldron

Learning objectives and outline

GLM review

Interpretation of main effects and interactions in logistic regression

The Design Matrix

Choice of design matrix (cont'd)

What if we forgot to code group as a factor?

```
group <- c(1, 1, 2, 2)
model.matrix(~ group)</pre>
```

```
## (Intercept) group

## 1 1 1

## 2 1 1

## 3 1 2

## 4 1 2

## attr(,"assign")

## [1] 0 1
```

## attr(,"contrasts")$agegroup
## [1] "contr.treatment"
##
## attr(,"contrasts")$wantsMore
## [1] "contr.treatment"
```

Levi Waldron

Learning objectives and outline

GLM review

Interpretation of main effects and interactions in logistic regression

The Design Matrix

Design matrix to contrast what we want

- Contraceptive use example
 - The effect of wanting more children different for 40-49 year-olds than for <25 year-olds is answered by the term age40-49:wantsMoreyes in this default model with interaction terms

	Estimate	Std. Error	z value	Pr(> z)
(Intercept)	-1.46	0.30	-4.90	0.00
age25-29	0.64	0.36	1.78	0.07
age30-39	1.54	0.32	4.84	0.00
age40-49	1.76	0.34	5.14	0.00
wantsMoreyes	-0.06	0.33	-0.19	0.85
age25-29:wantsMoreyes	-0.27	0.41	-0.65	0.51
age30-39:wantsMoreyes	-1.09	0.37	-2.92	0.00
age40-49:wantsMoreyes	-1.37	0.48	-2.83	0.00

Levi Waldron

Learning objectives and outline

GLM review

Interpretation of main effects and interactions in logistic regression

The Design Matrix

Design matrix to contrast what we want (cont'd)

• What if we want to ask this question for 40-49 year-olds vs. 30-39 year-olds?

The desired contrast is:

age40-49:wantsMoreyes - age30-39:wantsMoreyes

There are many ways to construct this design, one is with library (multcomp)
